

Assignment: Mini Task Manager App

Build a small React app with the following features:

1. **useState & Immutability**

- Maintain a list of tasks (array of objects: {id, title, completed})
- Add a new task using an input field (don't mutate the array directly — use spread operator)

2. **useRef**

- Use useRef to auto-focus the input field when the page loads
- Show a task count using innerText update via ref (optional, for practice)

3. **useEffect + API Call**

- On page load, fetch a sample task list from https://jsonplaceholder.typicode.com/todos?_limit=5
- Use **async/await** for the API call
- Show a loading state while fetching

4. **Toggle Complete**

- Clicking a task toggles its completed status (update state immutably)

5. **React Router**

- Create two routes: / (task list) and /about (a simple static page)
- Add a NavLink in a navbar to switch between them

6. **Context API**

- Create a ThemeContext (light/dark mode)
- Add a button to toggle theme, and use the context value to change background color

Submission Instructions

- Push your code to a **GitHub repository**
- Add a short README.md explaining how to run the project
- Submit the **GitHub repo link** in the submission box
